Programming for Design

For this assignment we had to write a program using Python. At the beginning I found Python confusing and hard to use. It was hard to understand the many different ways to write a similar program.

During this process it was easier to understand the capabilities of Python and the ways it can be used. Although, it started to make sense to me, I was and am still confused about some aspects.

My program writes a HTML and CSS file, and reads the ISBN.txt file. Once the ISBN text file has been read, the covers are located and shown in a list. I would have also liked to have had additional information on the screen to accompany the covers. This would have included the: title, author, publisher, and date it was published. Because I couldn't figure out how to do that, I just made a link that would accompany the cover, that led to the original library site for that particular book. I had tried to do this by looking up information on the internet, but I wasn't able to find much information

If I were to do this again, I would have actively sought help to figure out the problems I was running into. I would've liked to have included the extra information if I were able to.
